

TRAINING WORKBOOK MODULE-2

[Document subtitle]

ABSTRACT

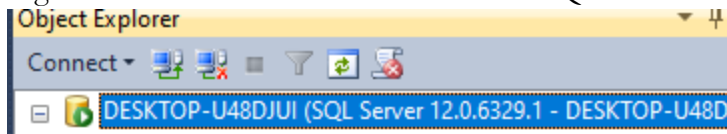

This module covers the steps required to create and configure a new database in SQL Server

NSTAR Technologies

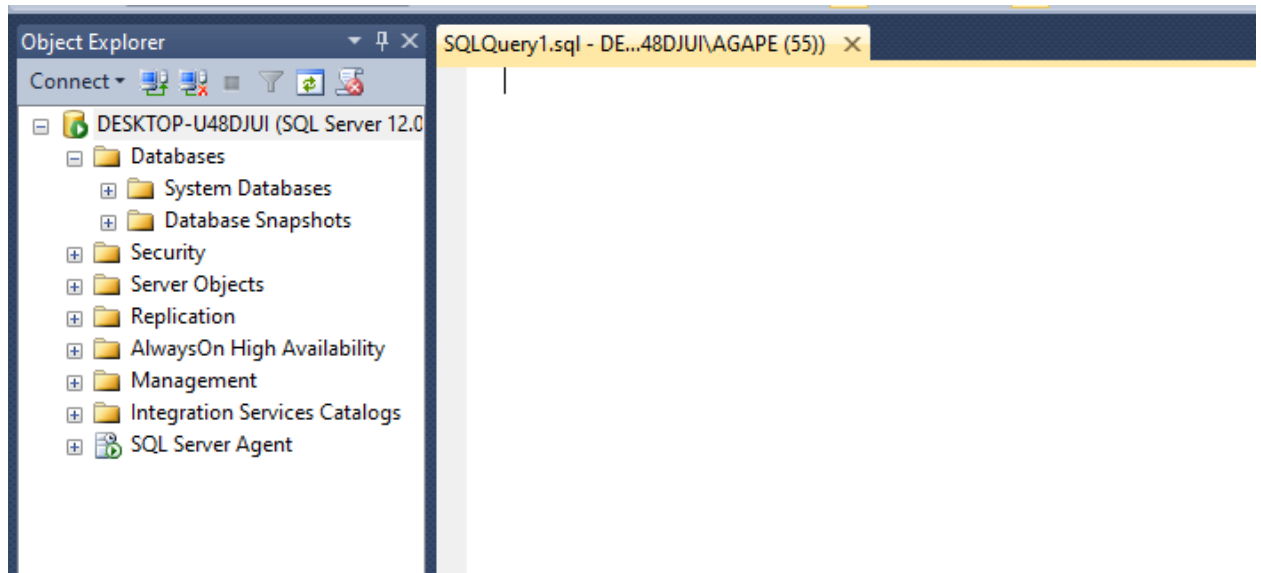

Certificate Program – Database Administration

1. Two ways of creating a database
TSQL Script

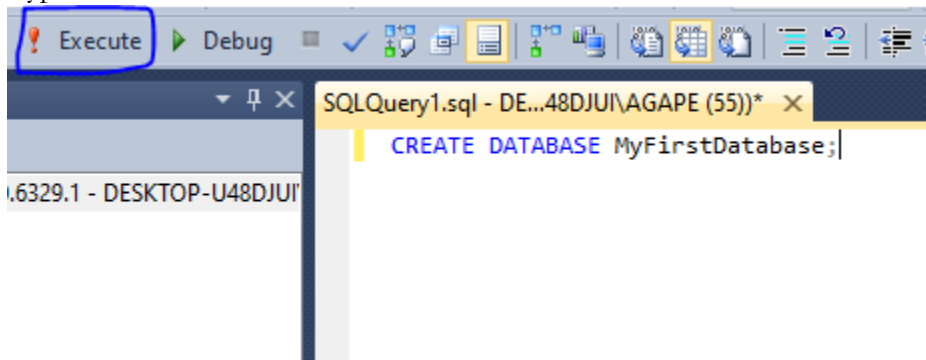

- Right click on server name and select NEW QUERY

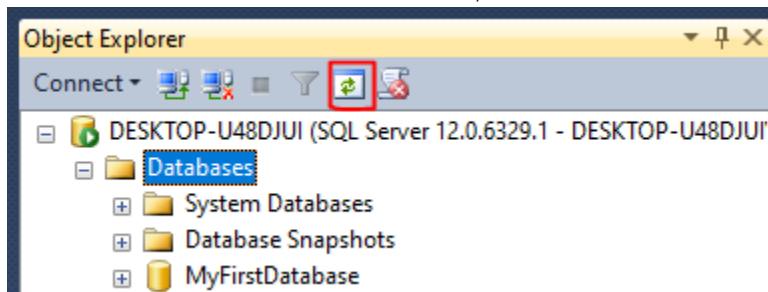

- You should see this

- Type Command “CREATE DATABASE database_name;” and click execute

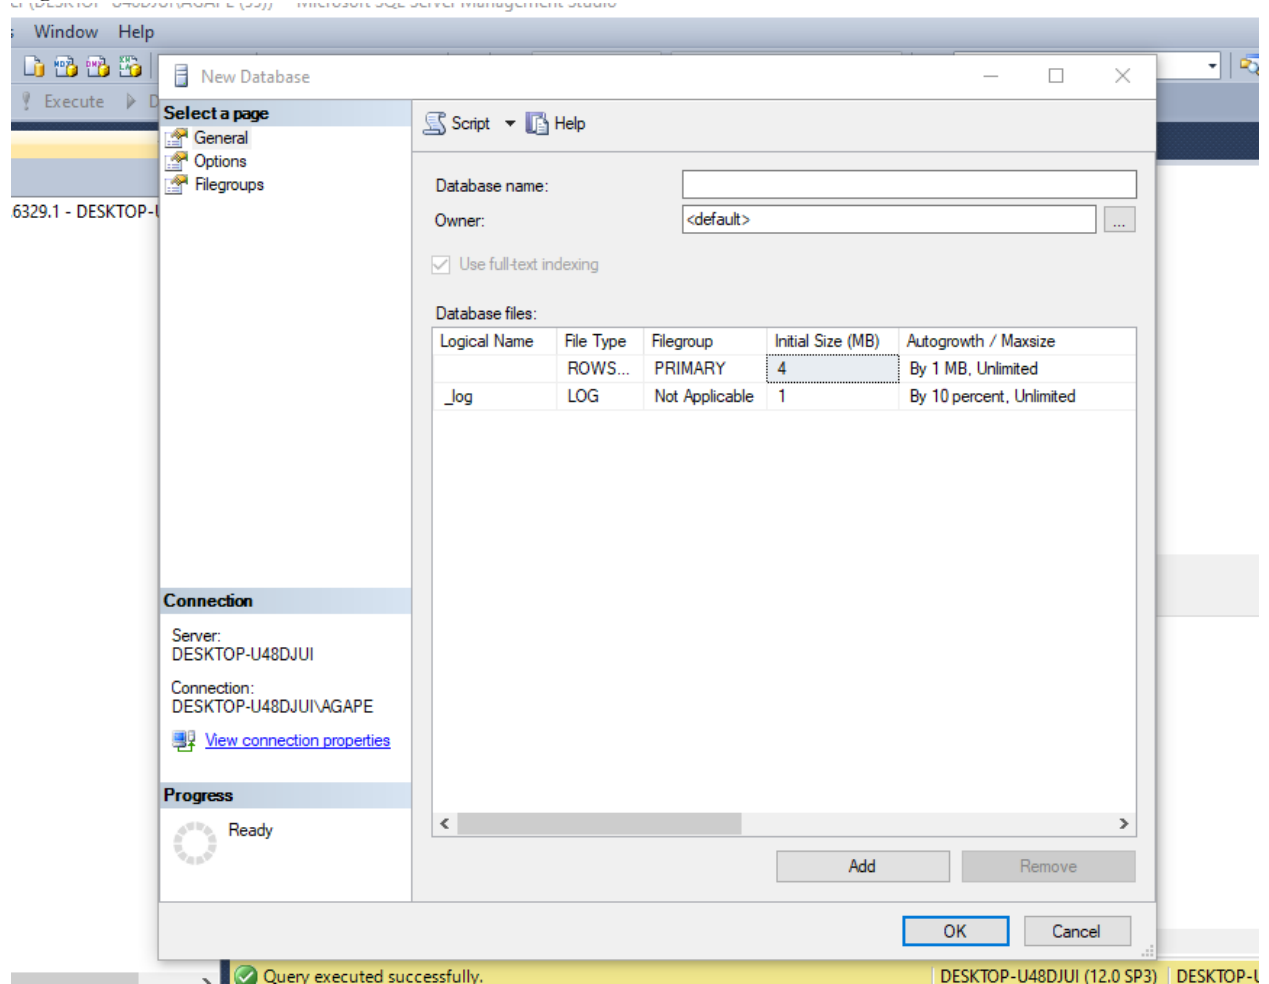

- Then select database and click refresh/f5

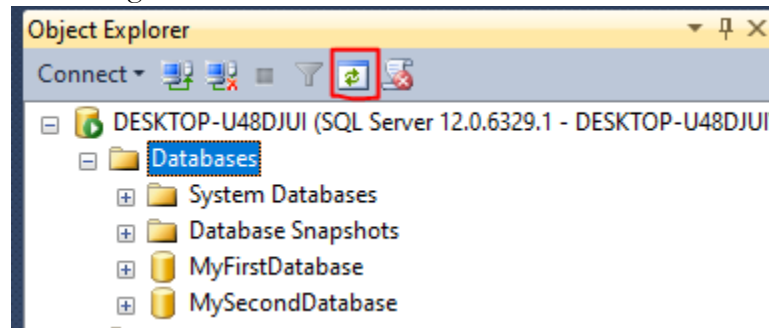

GUI

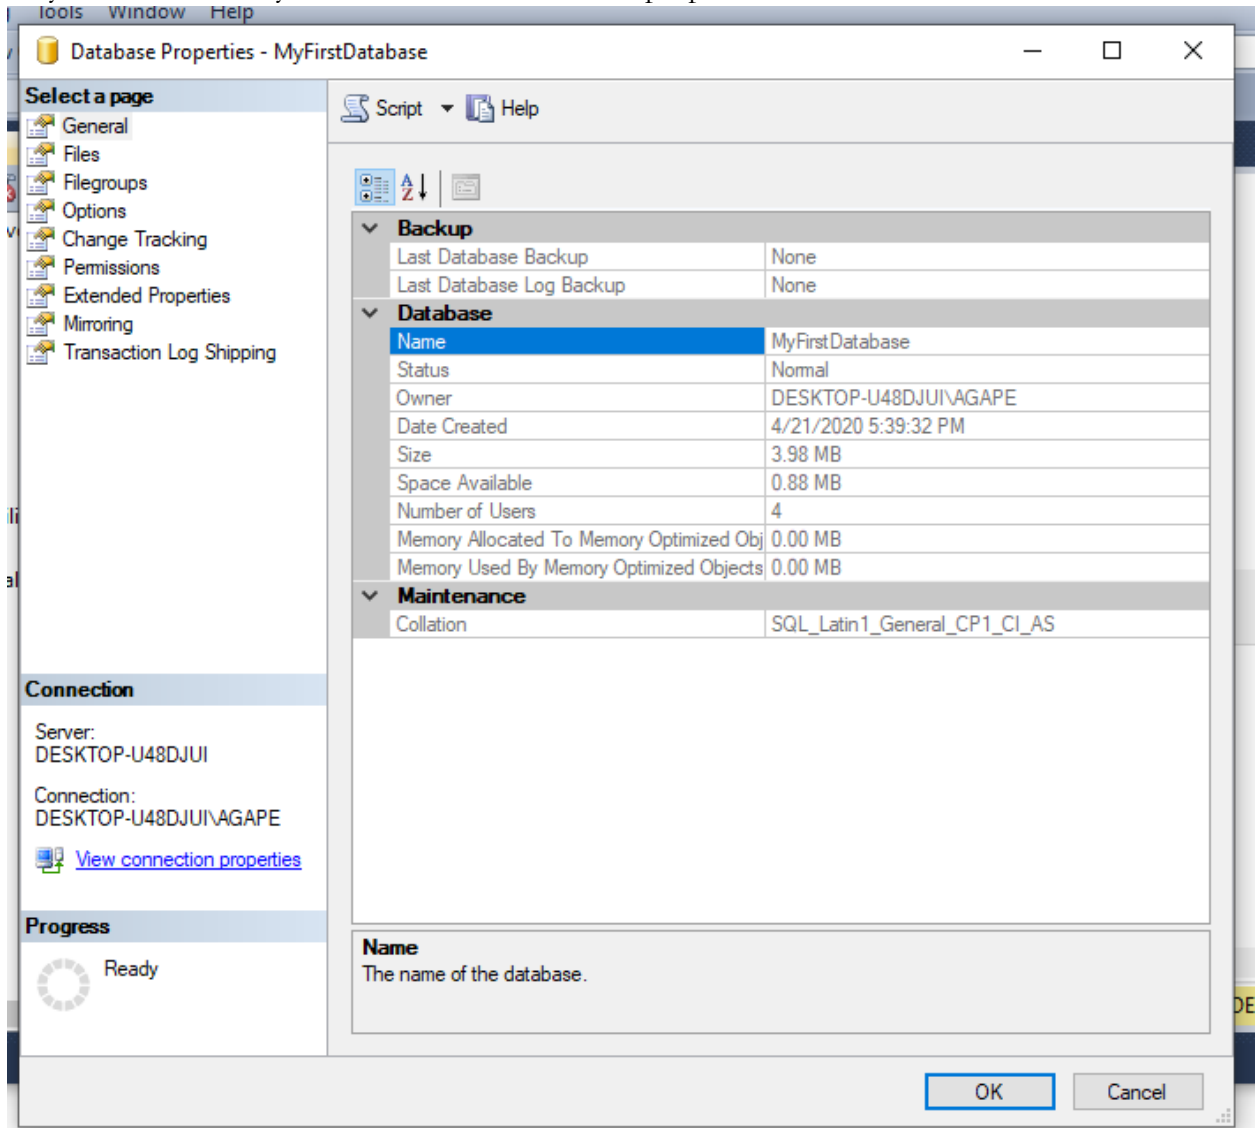

- Right click on database and select “NEW DATABASE”

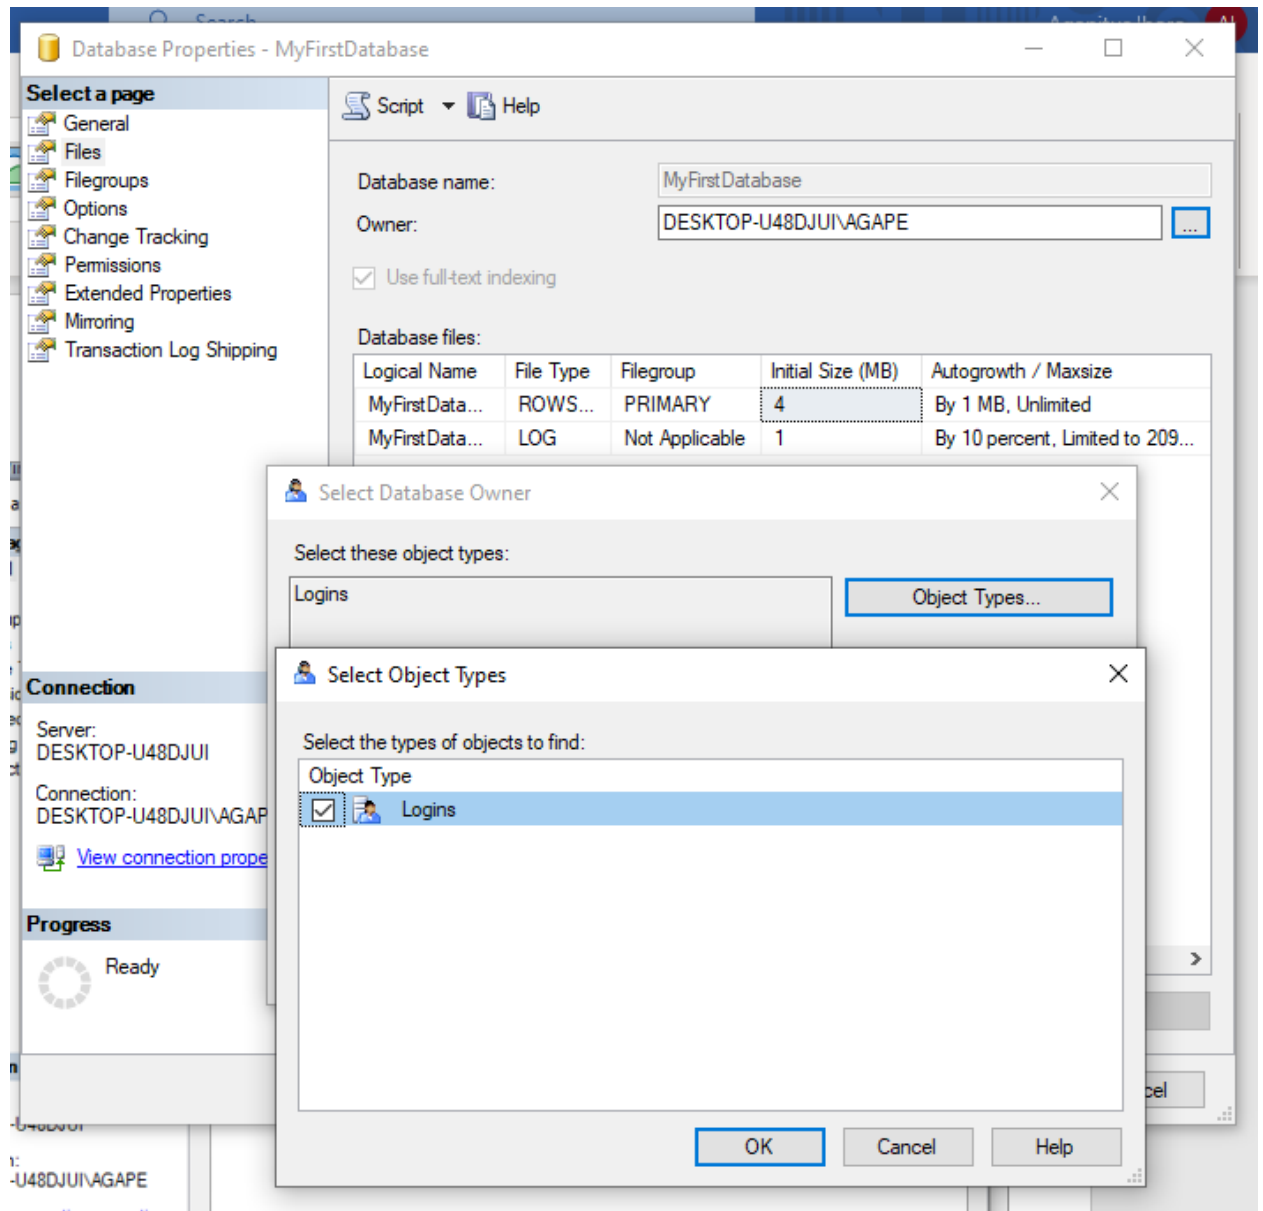

- Type MySecondDatabase into Database name and click ok
- Refresh again/ click f5

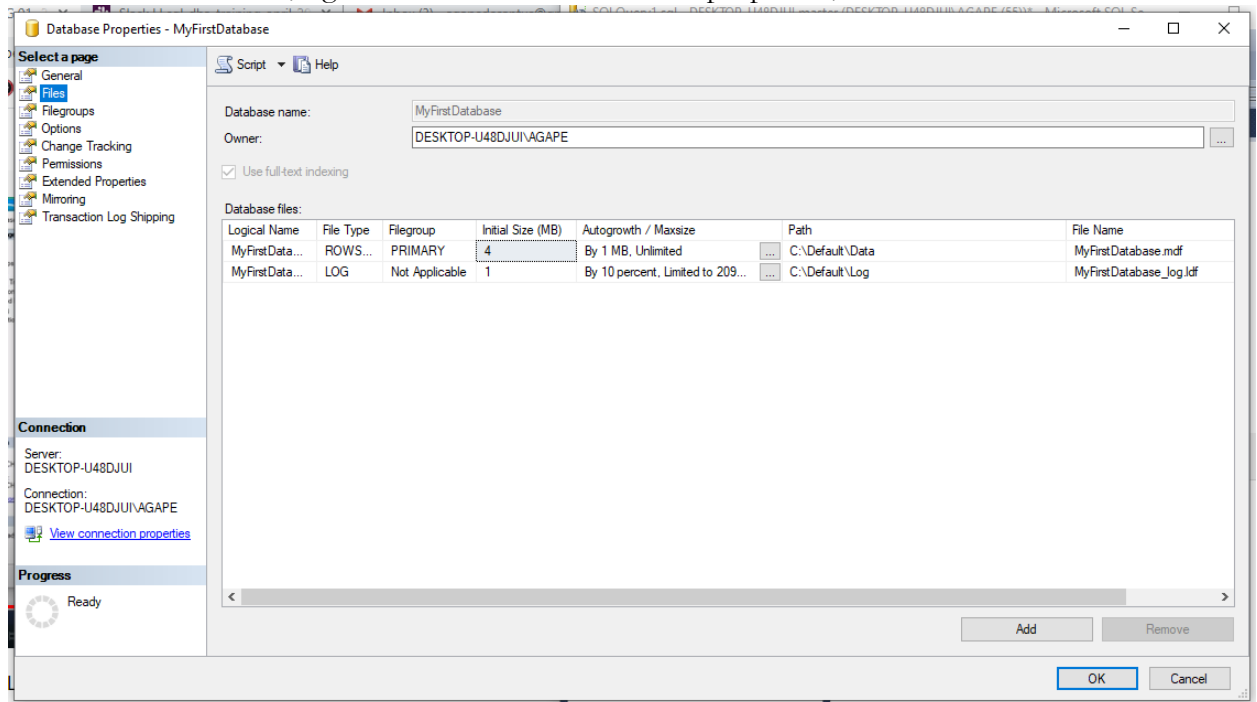

2. To go into the properties tab, right click on the Created database “MyFirstDatabase/MySecondDatabase” and select properties

3. On the Files tab select browse

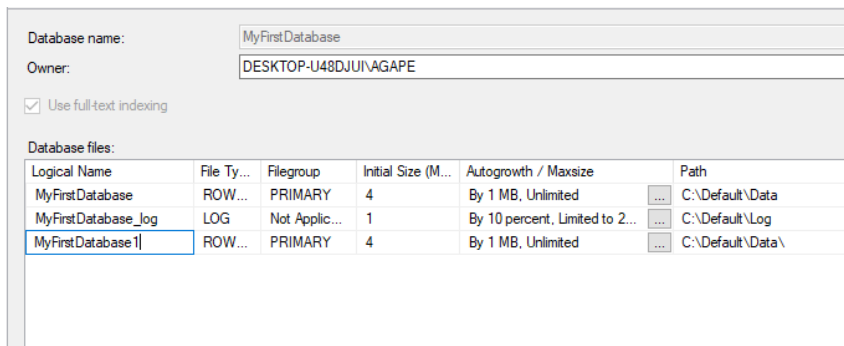

4. Discussion of File Tab, right click on database and click properties, then select Files

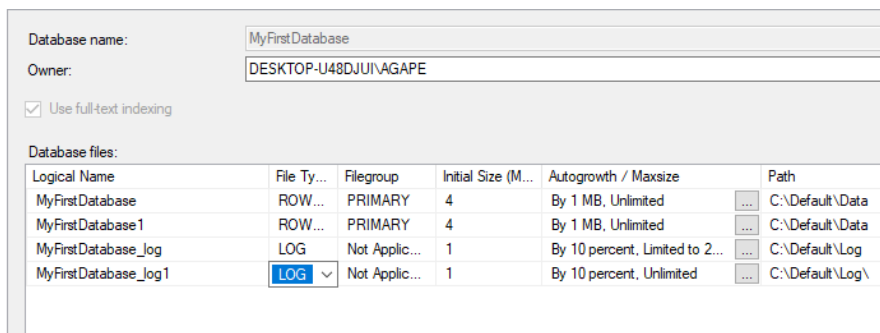

5. To add a new DATA FILE or LOG FILE click ADD

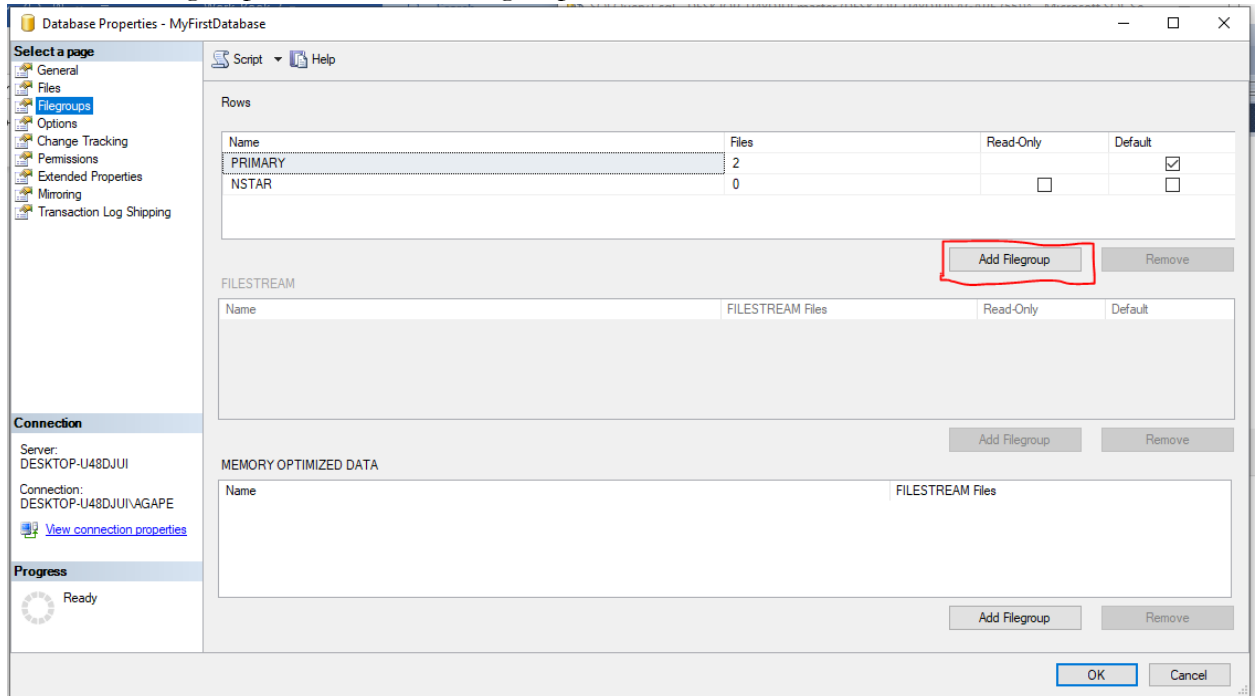

- For data file change file type to ROWS

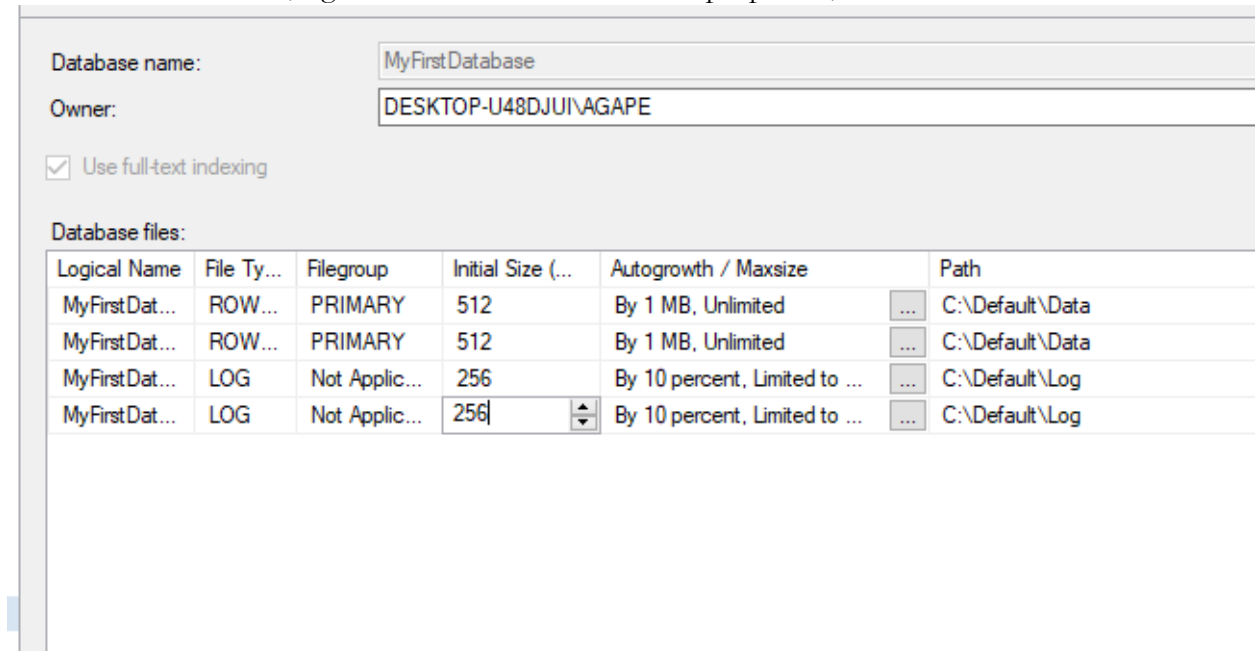

- For log files change file type to LOG

6. Click on FILEGROUPS to switch to file group tab
7. Click Add Filegroup to create a new filegroup

8. Discussion of File Tab, right click on database and click properties, then select Files

Initial Size (...)	Autogrowth / Maxsize	Path
512	By 1 MB, Unlimited	C:\Default\Data
512	By 1 MB, Unlimited	C:\Default\Data
256		
256		

 Change Autogrowth for MyFirstDatabase

☒ Enable Autogrowth

File Growth

☐ In Percent

☒ In Megabytes

Maximum File Size

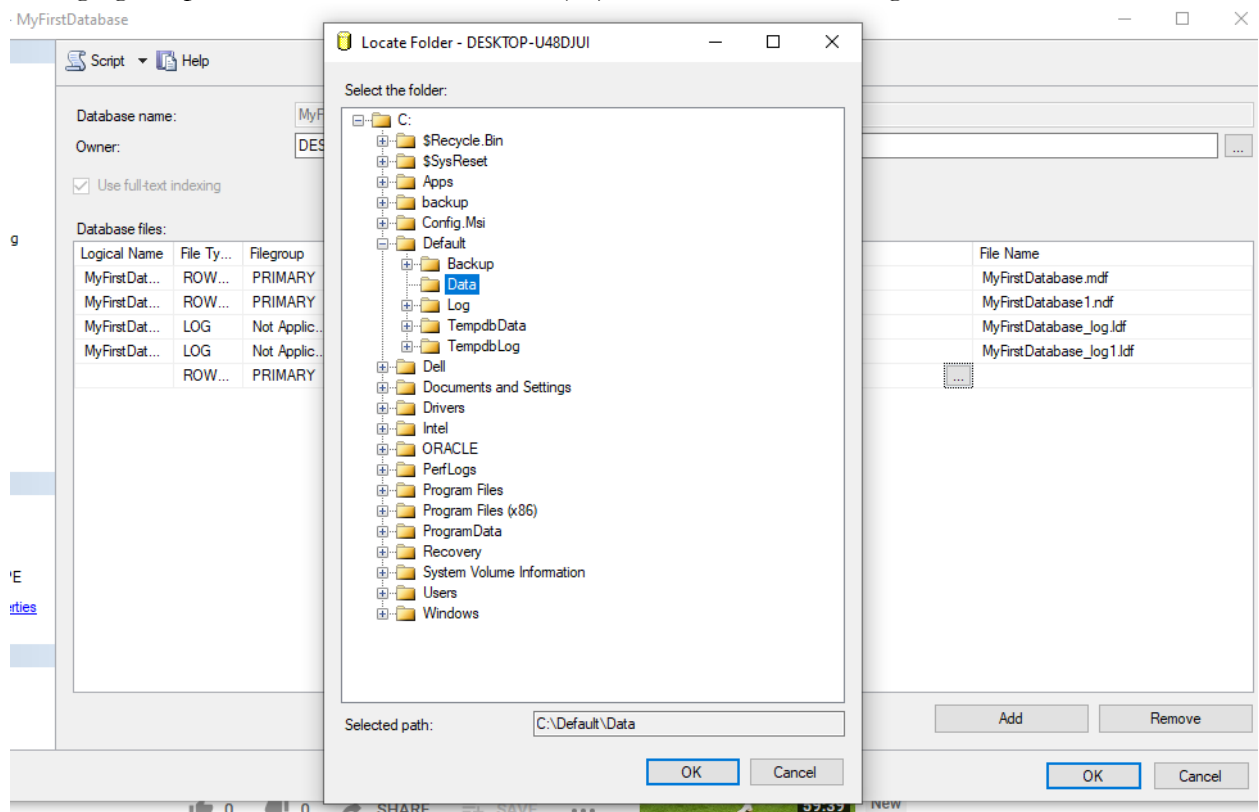

☐ Limited to (MB)

☒ Unlimited

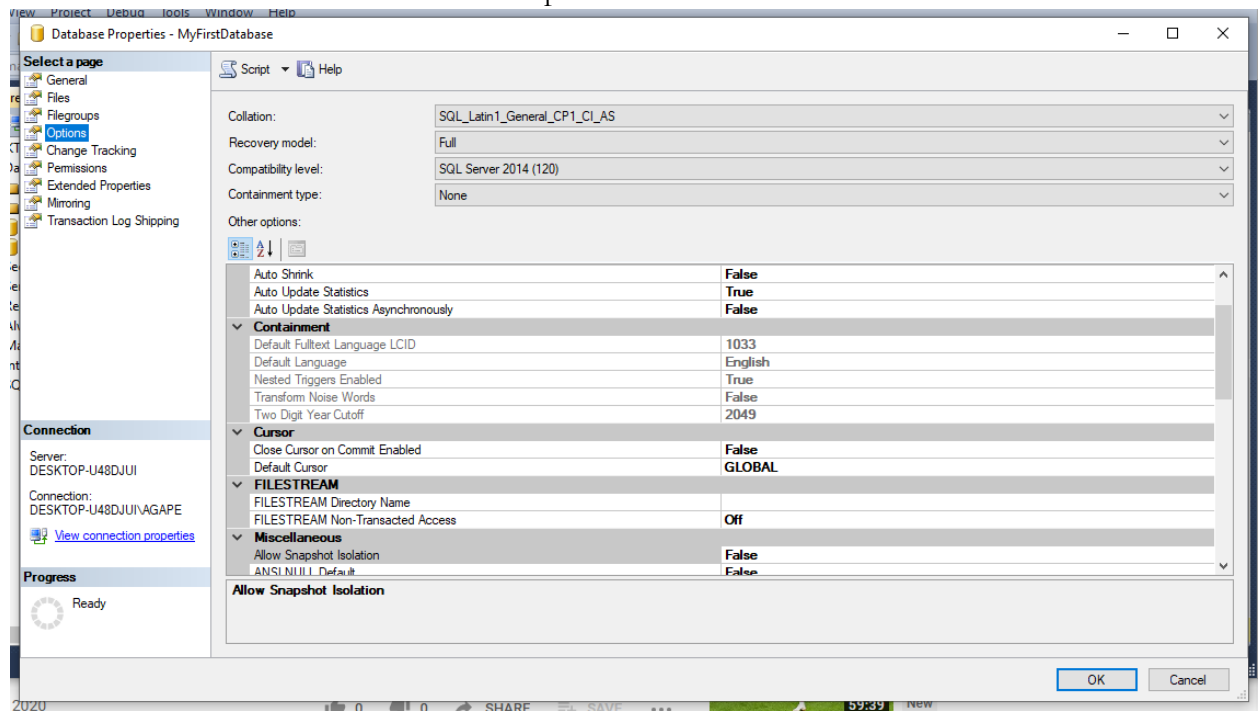

OK Cancel

e (M...	Autogrowth / Maxsize	Path
	By 256 MB, Limited to 1024 MB	C:\Default\Data
	By 256 MB, Limited to 1024 MB	C:\Default\Data
	By 10 percent, Limited to 2097152...	C:\Default\Log
	By 10 percent, Limited to 2097152...	C:\Default\Log

9. Changing the path of a file, click on browse (...) available when creating a new file

10. For discussion on OPTIONS TAB click Options on the left side

11. Click on Recovery model drop down menu to change from FULL, to SMALL, to BULK LOGGED
12. Click on Compatibility drop down menu to change

13. Scroll down to state for next activity

- First Change Database Read Only to TRUE

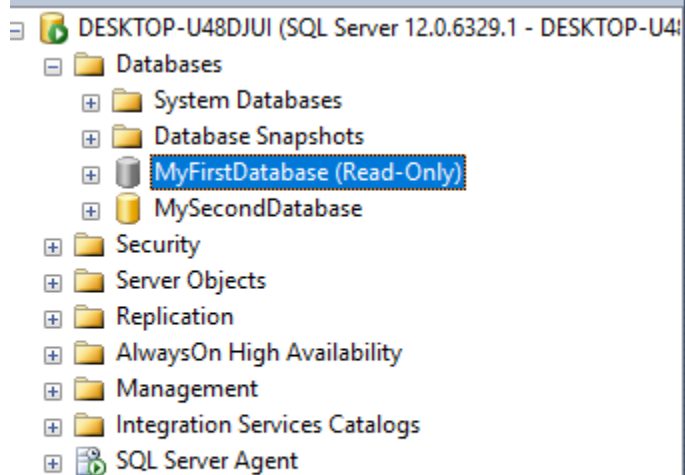

Connection: DESKTOP-U48DJUI
Server: DESKTOP-U48DJUI
Connection: DESKTOP-U48DJUI\AGAPE
[View connection properties](#)

Progress: Ready

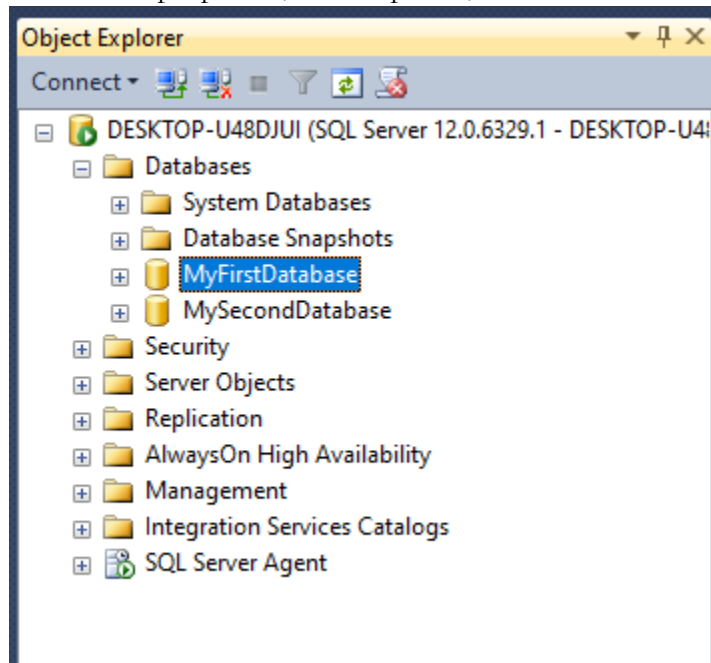

Property	Value
Quoted Identifiers Enabled	False
Recursive Triggers Enabled	False
Trustworthy	False
VarDecimal Storage Format Enabled	True
Recovery	
Page Verify	CHECKSUM
Target Recovery Time (Seconds)	0
Service Broker	
Broker Enabled	True
Honor Broker Priority	False
Service Broker Identifier	ac1b229a-8540-421e-938f-d88356c5ad43
State	
Database Read-Only	False
Database State	NORMAL
Encryption Enabled	False
Restrict Access	MULTI_USER

Allow Snapshot Isolation: ☒

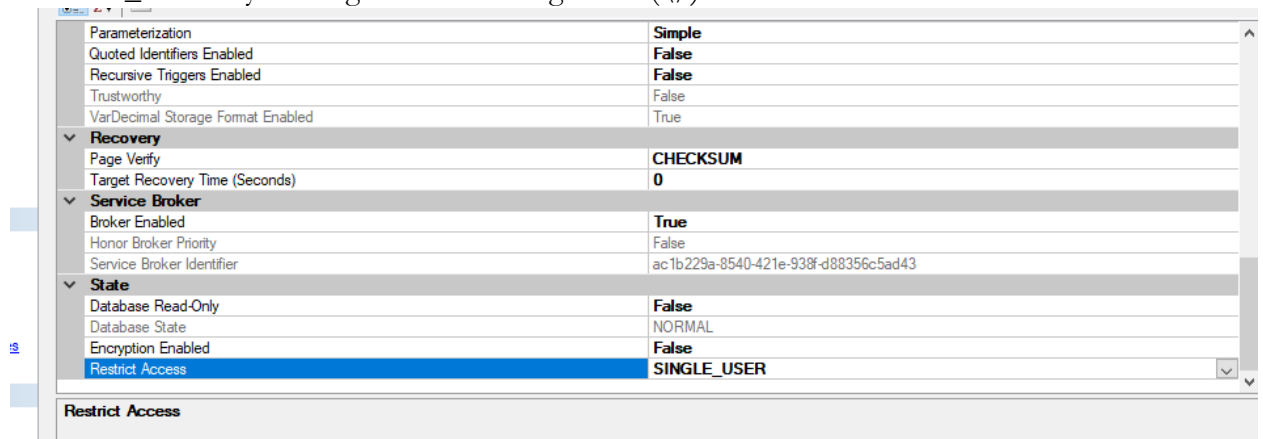

OK Cancel

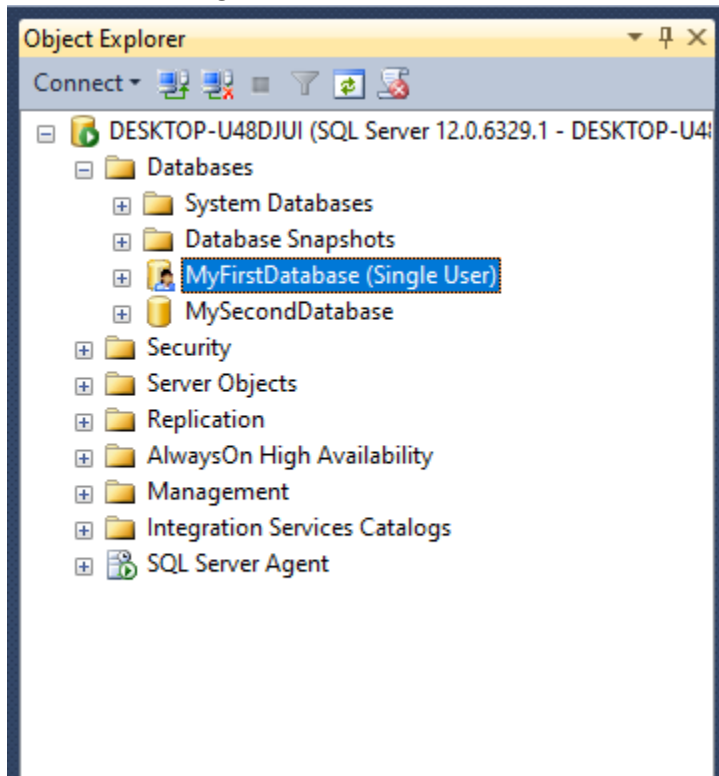

- Go back to properties, select options, scroll to state and change back to FALSE

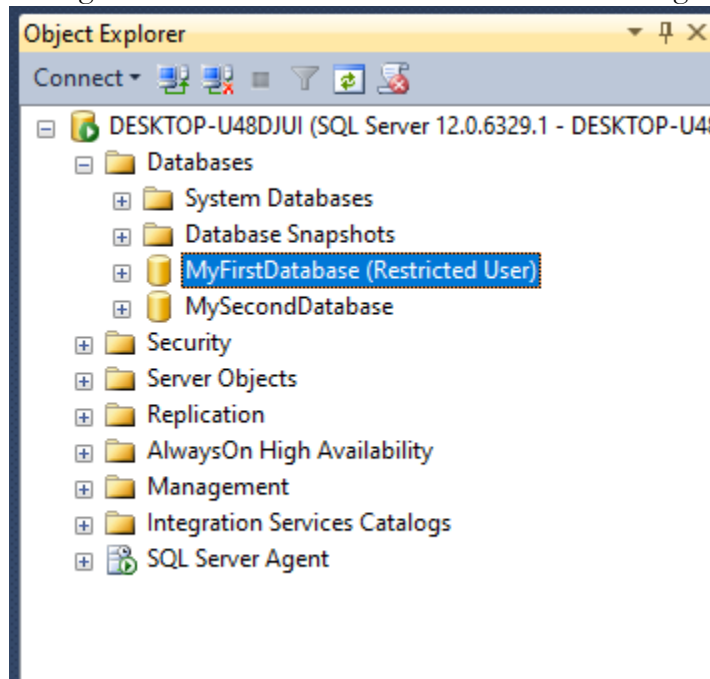

- Right click on database, select properties, select options, and change Restrict Access to SINGLE_USER by clicking on arrow facing down (∨)

- Proof of change

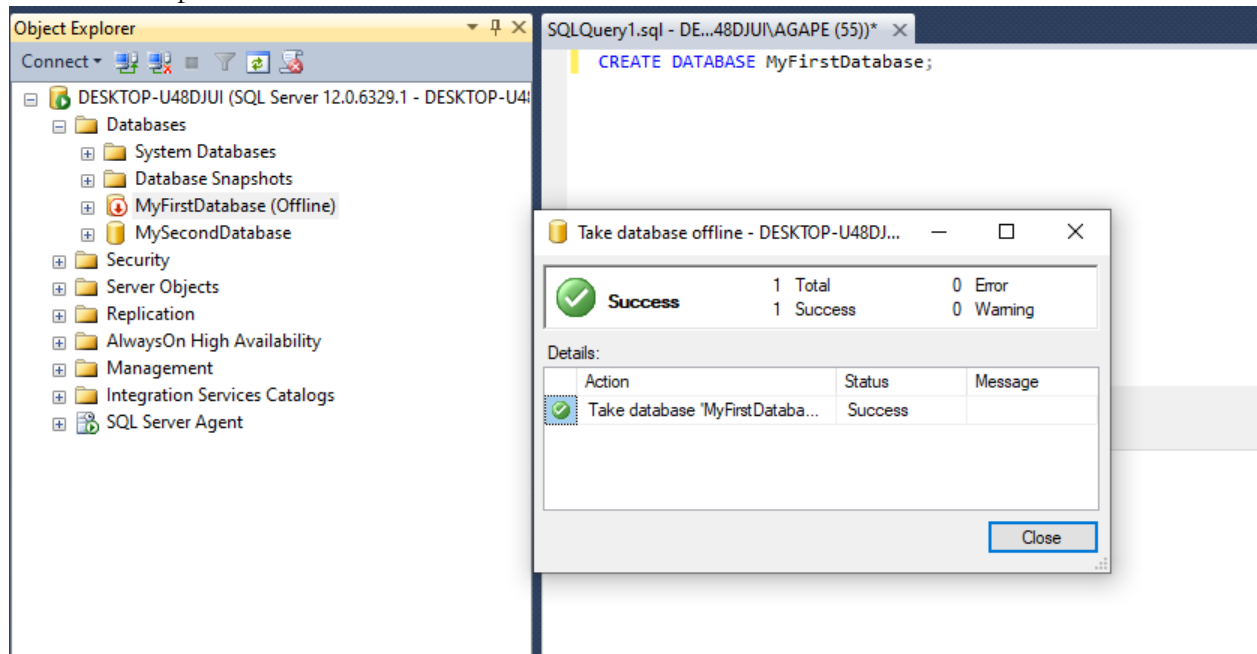

- Next go back to Restrict Access under State and change to RESTRICTED_USER

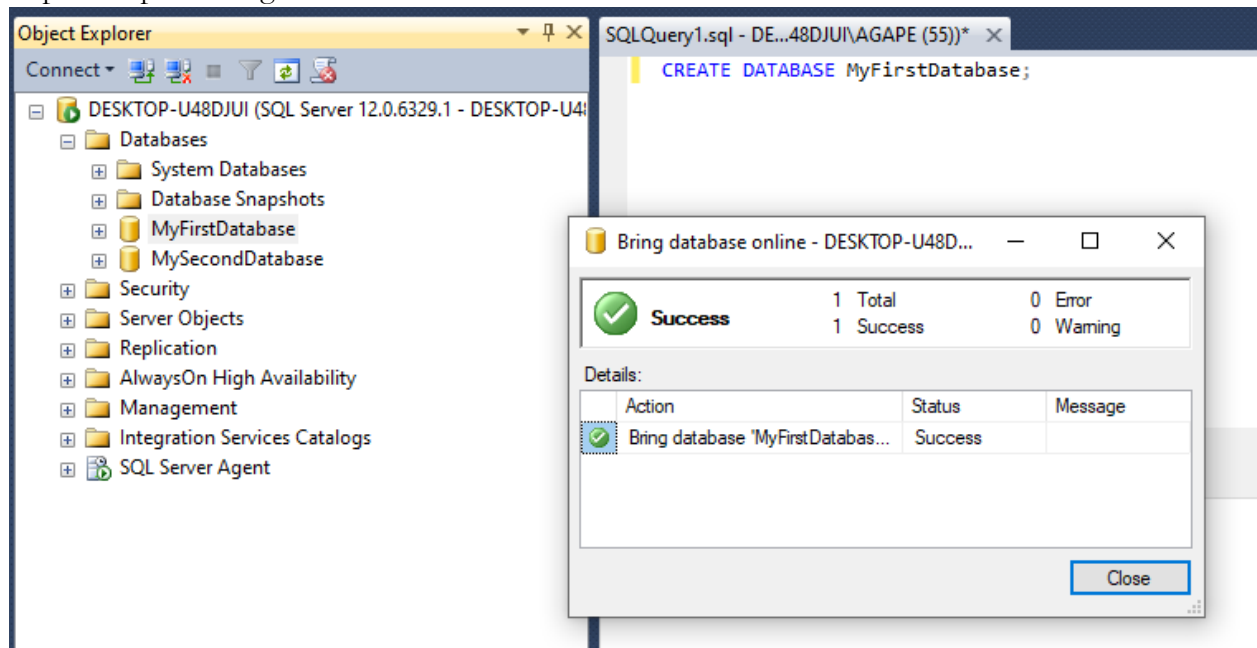

15. To take a database offline Right click on database Select task, then select take offline

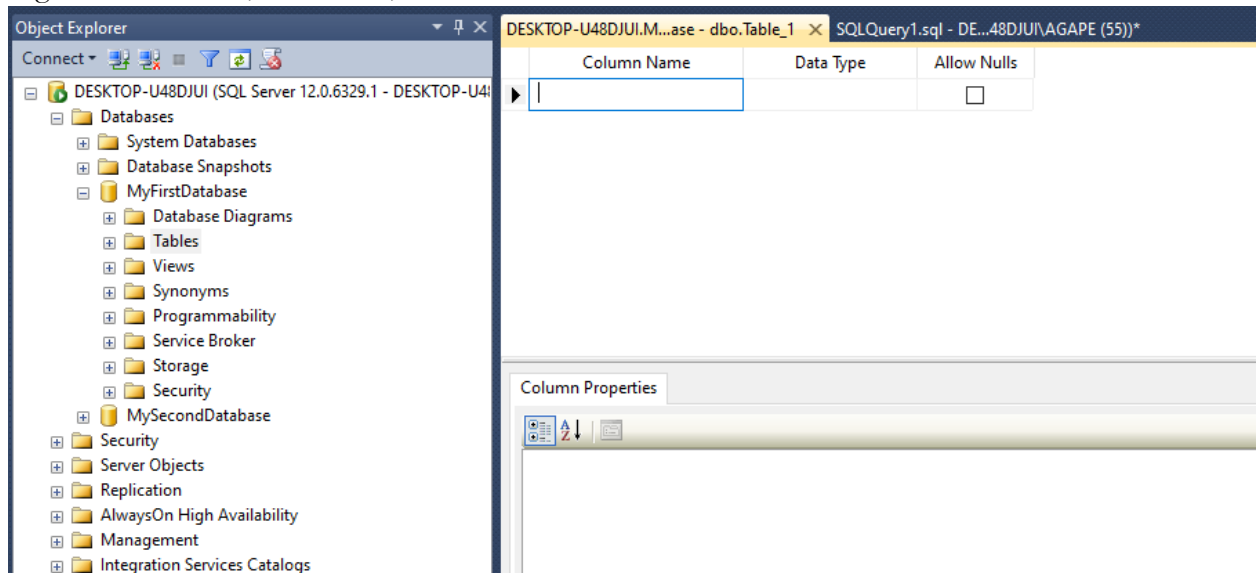

- Proof of completion

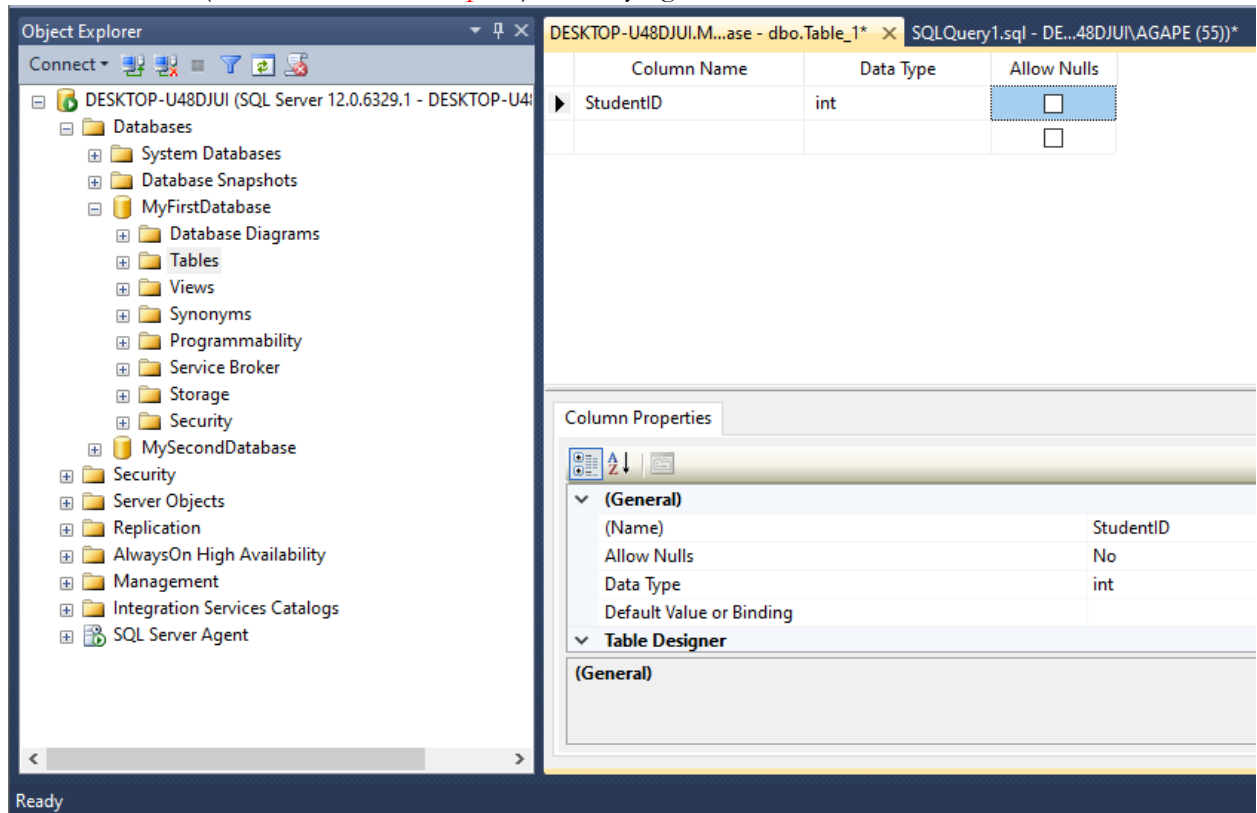

- Repeat Steps to bring online

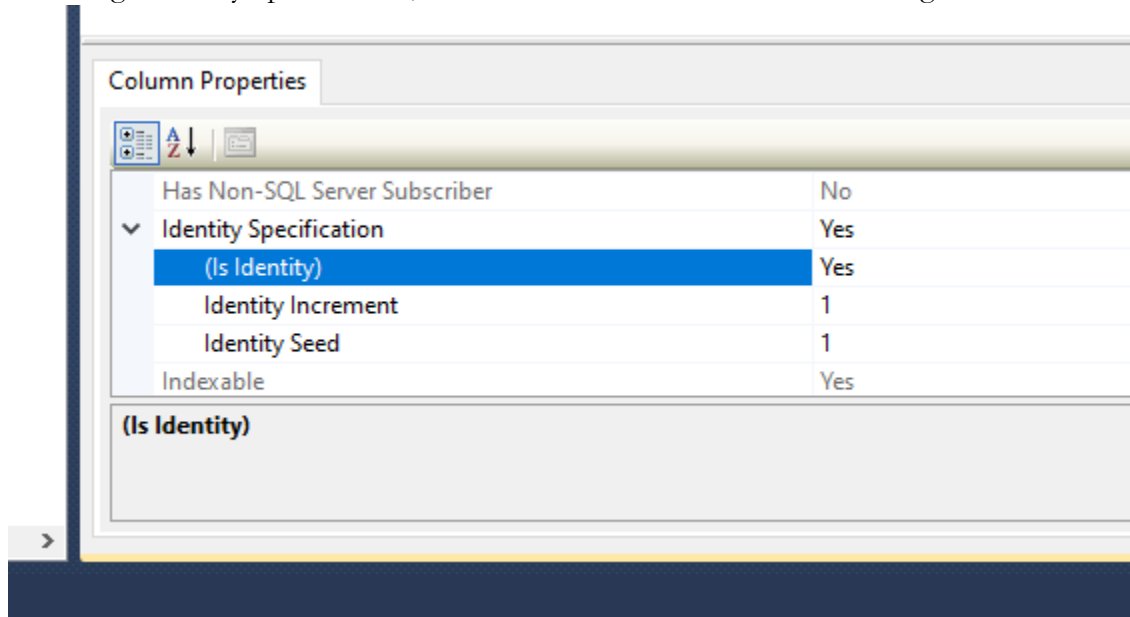

16. To create a new table, expand a user database “MyFirstDatabase/MySecondDatabase”
17. Right click on table, select new, then select table

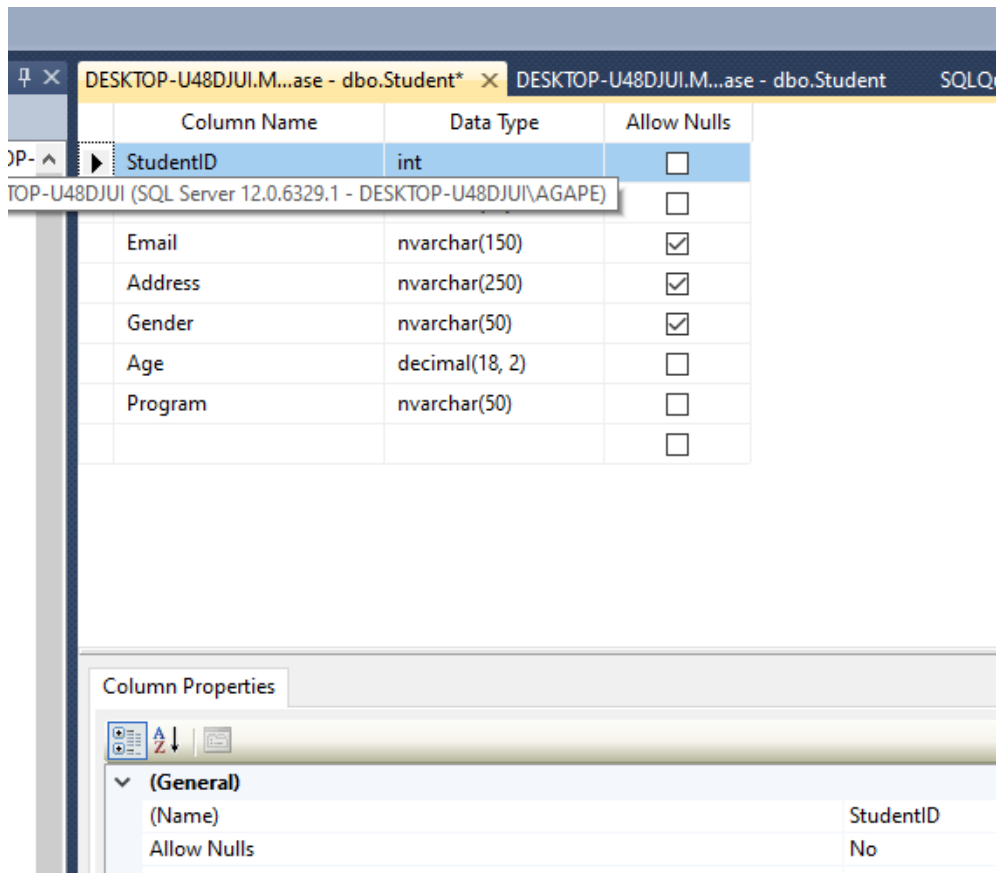

18. Fill in columns (NOTE: do not use space) when tying in column name

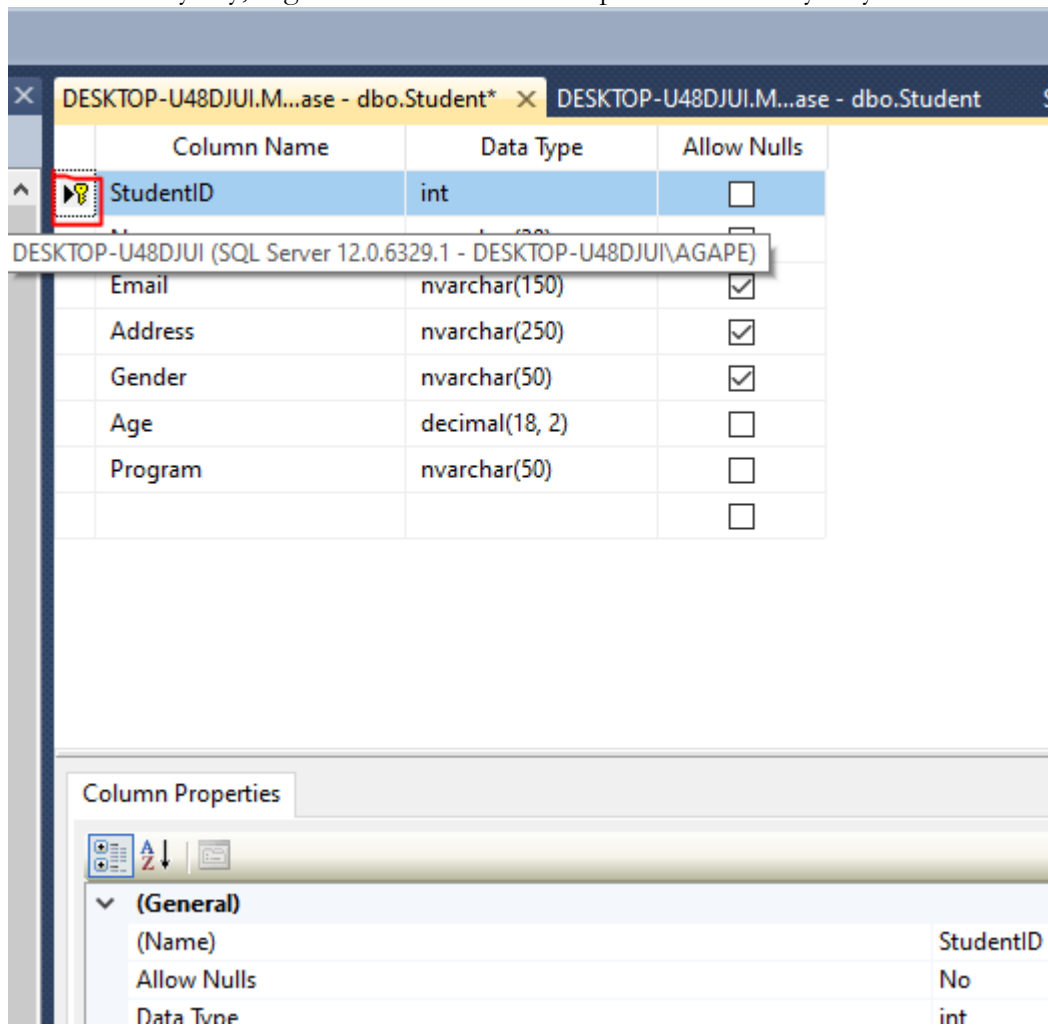

19. To change Identify Specification, scroll down to IS IDENTITY and change to YES

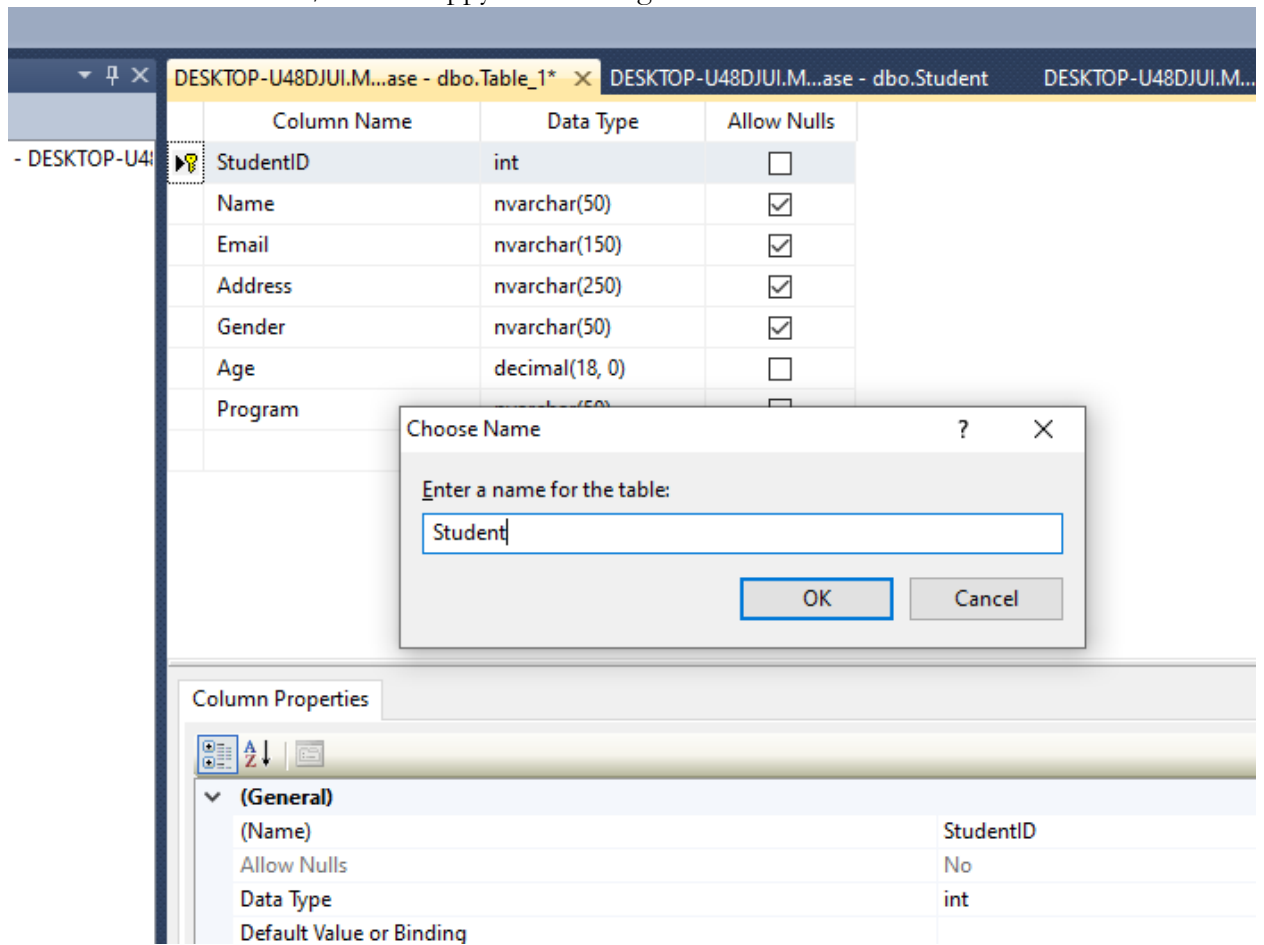

20. Fill columns as needed

21. To set Primary key, Right click and select first option Set Primary Key

22. To Save table click ctrl S/ select floppy disk looking icon

- To see table select Tables and refresh
